ABSTRACT:

AI BlogNest is a modern blogging platform developed to help users create, manage, and explore blog content easily. The application combines normal blogging features with Artificial Intelligence to make content creation simpler and more interactive.

Users can create accounts, write blogs, edit and publish posts, explore different categories, search for content, and interact with other users.

The AI features provide additional support during content creation, such as generating ideas, improving content, suggesting titles, or assisting users based on the features implemented in the project.

Key Features

- User registration and login
- Blog creation and publishing
- AI-assisted content creation
- Blog categories
- Search functionality
- User profile
- Blog management
- Reader interaction

PROBLEM STATEMENT:

Traditional blogging systems mainly focus on writing and publishing content.Users may face difficulties such as:

- Finding suitable topics
- Creating attractive titles
- Organizing content
- Improving written content
- Finding relevant blogs
- Managing multiple posts

AI BlogNest provides an integrated platform where blogging and AI assistance are brought together in one application.

OBJECTIVES:

 To develop a simple blogging platform.

 To provide AI-assisted content creation.

 To allow users to create and publish blogs.

 To organize blogs using categories.

 To provide easy blog searching.

 To allow users to manage their posts.

 To provide a user-friendly interface.

 To make content creation easier for beginners.

PROJECT FEATURES:

This page can be your **main feature page**.

👤 User Management

- User registration
- User login
- User profile
- Authentication

🔐 Security

- JWT authentication

- Password hashing using bcrypt
- Protected API routes
- Environment variables for sensitive configuration

📝 Blog Management

- Create blog
- Read blog
- View all blogs
- View individual blog
- Update blog
- Delete blog

🤖 AI Features

- Generate complete blog from topic
- Summarize blog content
- Gemini AI integration

⚙️ Backend Features

- REST API
- Express.js
- MongoDB
- Mongoose
- MVC architecture

USER AUTHENTICATION:

The authentication module manages user access to AI BlogNest.

Registration

A new user provides:

- Name
- Email
- Password

The registration API is:

POST /api/auth/register

Login

Registered users provide:

- Email
- Password

The login API is:

POST /api/auth/login

After successful login, the system provides an authentication token that can be used for protected requests.

Profile

The authenticated user can access their profile using:

GET /api/auth/profile

The request uses a Bearer JWT token.

BLOG MANAGEMENT:

AI BlogNest provides complete CRUD operations.

C — Create

Users can create a new blog using:

POST /api/blogs

R — Read

Users can retrieve:

- All blogs
- Individual blog

U — Update

Existing blogs can be modified using:

PUT /api/blogs/:id

D — Delete

Blogs can be removed using:

DELETE /api/blogs/:id

The project therefore provides a complete blog management lifecycle.

AI BLOG GENERATION:

This is one of the main unique features of AI BlogNest.Instead of writing the complete article manually, the user can provide a topic.

Example

Input:

Artificial Intelligence

The system sends the topic to the Gemini AI service.

Process

User Topic
↓
AI API
↓
Gemini Processing
↓
Generated Blog
↓
Response to User

The API endpoint used is:

POST /api/ai/generate-blog

The project documentation specifically defines this endpoint for generating a blog from a supplied topic.

AI SUMMARIZARION:

AI BlogNest provides an AI summarization feature that converts lengthy content into a shorter version.

Process

Long Blog
↓
AI Summarization
↓
Important Information
↓
Short Summary

The API endpoint is:

POST /api/ai/summarize

The user sends the blog content, and the AI service returns a summarized version.

TECHNOLOGY STACK:

Node.js

Used as the runtime environment for the backend application.

Express.js

Used to build the REST API and handle HTTP requests.

MongoDB

Used to store application data.

Mongoose

Used to interact with MongoDB using structured models.

JWT

Used for authentication and protected routes.

bcrypt

Used for secure password hashing.

Gemini AI

Used for AI-powered blog generation and summarization.

Axios

Used for HTTP/API communication where required.

These technologies are included in the project's dependency configuration.

API STRUCTURE:

Module	Method	Endpoint
Register	POST	/api/auth/register
Login	POST	/api/auth/login
All Blogs	GET	/api/blogs
Generate	POST	/api/ai/generate-blog
Summarize	POST	/api/ai/summarize

ADVANTAGES:

🚀 **Faster Content Creation**

AI can generate blog content from a topic.

🤖 **Intelligent Assistance**

Gemini AI provides content-related functionality.

🔐 **Secure Authentication**

JWT and bcrypt improve user security.

📝 **Complete Blog Management**

Users can create, read, update and delete blogs.

📄 **Quick Summarization**

Long content can be converted into a shorter summary.

🗄️ **Reliable Data Storage**

MongoDB provides database storage.

🔧 **RESTful Design**

The backend can be accessed through well-defined API endpoints.

FUTURE ENHANCEMENTS:

The project can be extended with:

- User comments
- Blog likes
- Blog search
- Category filtering
- Image upload
- AI title generation
- AI keyword generation
- User-specific recommendations
- Reading history
- Admin dashboard
- Blog analytics
- Social media sharing
- Multi-language AI generation
- Voice-based blog creation

CONCLUSION:

AI BlogNest successfully combines a RESTful blog management system with Artificial Intelligence.

The project provides secure user authentication, complete blog CRUD operations, MongoDB-based data storage and Gemini-powered AI functionality.

The two major AI capabilities — **blog generation and summarization** — make the project more than a conventional blog management API.

The project demonstrates practical knowledge of:**Node.js + Express + MongoDB + Mongoose + JWT + bcrypt + Gemini AI + REST API**

Overall, AI BlogNest provides a foundation for developing a smarter and more efficient content management platform.
